

echoes To Go

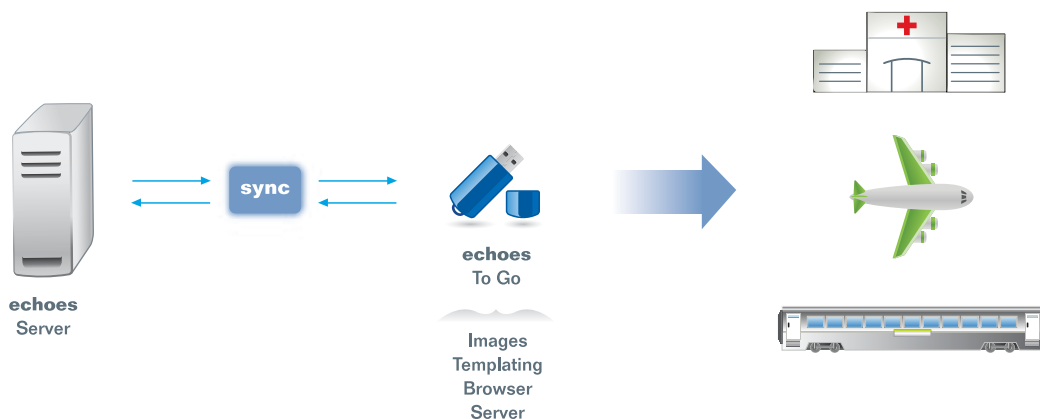

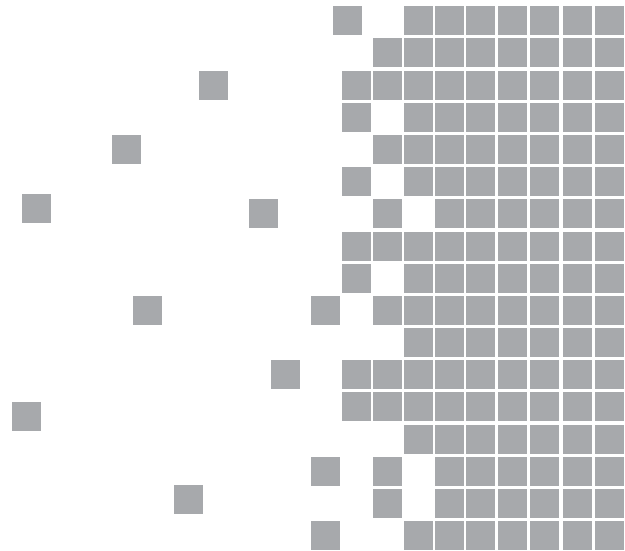

Now orthopedic surgeons can take their patient images with them, along with the entire Medstrat PACS system – all on an inexpensive USB thumb drive.

echoes To Go

The unique architecture of the Medstrat PACS system pairs the **echoes** Server and the **echoes** Browser to provide orthopedic practices with an unprecedented level of speed, reliability and flexibility of access. Because the **echoes** Browser is a real web browser under-the-hood, it allows users outside the office real-time access to the Medstrat PACS system any time and anywhere there is an Internet connection.

But in the real world, getting Internet access everywhere is not always possible. Take for instance when orthopedic surgeons are at the hospital and want to access their patient images. Many hospital computers do not allow public Internet access, nor do they allow installation of applications, such as the **echoes** Browser, on their PCs.

Medstrat's **echoes** To Go is the solution. Now orthopedic surgeons can take their patient images with them, along with the entire Medstrat PACS system, via an inexpensive USB thumb drive which requires no Internet connection and runs on any Windows PC that has a USB port.

Using **echoes** To Go feels like you've never left the office.

In the office, a surgeon simply plugs in a USB thumb drive into their workstation and “syncs” the images they selected to take with them through the **echoes** Browser software. When they're at the hospital or anywhere else, they simply plug in the USB thumb drive into any PC, double-click the **echoes** Browser on the USB thumb drive, and it's like they never left the office. When they return to the office, they simply “sync” any changes that were done to the images outside the office, and the changes are automatically updated on the **echoes** Server.

The reason **echoes** To Go is so easy to use is because the **echoes** Browser runs on-the-fly directly off the USB thumb drive. There is no installation of any software on the PC that the USB thumb drive is plugged into. Plus, all the patient images, templating data and all other tools that are available through the **echoes** Browser are packaged together on the USB drive ready to go anywhere. Using **echoes** To Go feels like you've never left the office.
